SHOP SAFETY AND TRAINING IN ACADEMIC DEPARTMENTS

1. All students and employees (staff and faculty) are required to complete documented safety training prior to using any machines or power tools in a fabrication/repair shop. Training records must be maintained by the department. These records will be reviewed by the Department of Environmental Health and Safety (EH&S) upon request and during an annual inspection of each shop. The information covered in the shop training will include:

   - Tour of the shop
   - Review of all safety rules and practices
   - Injury and Illness Prevention Program
   - Building evacuation route, emergency procedures and emergency telephone location
   - Demonstration and practice on the proper use of machine tools, hand tools and welding equipment. (All machine tools, hand tools, and welding equipment have potential safety hazards. Machine tools and welding equipment can only be used if safety training on that machine has been completed and documented. Students may become authorized to use machine tools and welding equipment under the supervision of shop staff by successfully completing specific shop safety training delivered by the shop manager. The content of this training will be determined by the shop manager with the approval of EH&S. Infrequent shop users may be asked to repeat safety training at the discretion of the shop manager.)

2. Students must be able to demonstrate to the satisfaction of the shop manager their proficiency in the use of a particular machine or power tool before they can operate that equipment in an unsupervised manner. This proficiency must be documented by the shop manager.

3. Tools and equipment that produce sparks, such as cutting, welding, metal cut off saw, metal grinder must not be used by unsupervised students.

4. The shop manager may remove any student, employee or faculty member from the shop for unsafe practices or unsafe behavior.

5. Shop employees may require additional training on other topics including lock-out tag-out, hot work procedures, and hearing conservation, based on hazard assessments by the shop manager and/or EH&S.
6. Chemical Hygiene training is required for any shop users that handle chemicals of any kind. This training is given by EH&S, and the training must be renewed every three years.

7. Use of certain chemicals or welding operations may require additional respiratory protection training and fit testing from EH&S.

8. No one should be allowed to work in any shop alone. There should be a minimum of two people in the shop at all times when machines or tools are in use. An individual working alone in the shop might not be able to get emergency help in the event of an accident.

9. Location of phones to use in the event of an emergency as well as any safety equipment present in the shop should be well-marked and highly visible.

10. The shop should remain locked when unattended, and access to the shop should be restricted to authorized persons.

11. Any faculty, staff or student that demonstrates habitual or egregious disregard for shop safety guidelines may lose privileges to operate shop equipment or tools, or may lose privileges to access the shop.

The following is required by all users of the Departmental shops. Violation of these principles may result in loss of facility access or other disciplinary action.

1. Eye Protection

Eye protection [that meets American National Standards Institute (ANSI) Z-87.1-2010] must be worn at all times while in the shop, except for offices, restrooms, and break areas. Safety glasses with side shields should be made available for occasional users and visitors. Frequent users of these facilities are encouraged to obtain their own safety glasses from the departmental stockroom.

For individuals with corrective glasses, eye protection must be of the type that can be worn over glasses. Prescription-ground safety lenses may be substituted if they provide equivalent protection and if side shields are firmly attached to the glasses frame.

All individuals who are welding or viewing welding activities must wear eye protection from the radiation produced by welding. Appropriate eye protection will be provided at the welding areas.
Arc welding or arc cutting operations require the use of welding helmets with an appropriate filter lens.

Goggles with filter plates or tinted glass are required for gas welding or oxygen cutting operations.

Full-face shields and safety glasses are required for portable hand grinding operations.

2. **Hand and Body Protection**

   - Neck Ties, hanging jewelry (necklaces, earrings, etc) rings, watches, bracelets, unbuttoned long sleeves, dresses, or other loose clothing cannot be worn while operating machinery.
   - Long hair must be tied back or covered by a cap while operating machinery.
   - Long pants must be worn when working with any machine tools or equipment, sheet metal or metal scraps, and welding equipment.
   - Gloves must not be worn when operating any rotating machinery. Gloves are recommended for handling sheet metal and sharp tools.
   - Machine guards provided for a machine must be in place whenever the machine is operated. Guards or shields removed for maintenance or cleaning must be replaced before the machine is used.
   - Avoid skin contact with mill cutters, metal chips, and metal burrs.
   - Chemical resistant gloves must be worn whenever paints, epoxies, solvents, or other chemicals are used. Disposable nitrile gloves are provided that are effective barriers for most chemicals found in the shop areas. Other glove types will be provided if nitrile gloves are insufficient for a specific chemical needed in the shop areas.

3. **Respiratory Protection**

   Occasional shop users do not need fitted respirators when welding carbon steel unless a significant amount of welding is planned. If galvanized or stainless steel is being welded, local exhaust ventilation is recommended.

   Fitted respirators must be worn when welding stainless steel or galvanized metal, or when using uncured epoxies.
Welding must be conducted with good ventilation. Portable welding fume extractors and auxiliary ventilation are strongly recommended whenever welding is occurring inside the shop areas.

4. Foot Protection

Closed-toe shoes must be worn when working with any machine tools or equipment, hand tools, sheet metal or metal scraps, and welding equipment.

5. Chemical Safety

All oil and other chemical waste are to be disposed properly. Absolutely no chemicals or oils are to be dumped in the sink. The shop manager must be consulted for proper waste disposal procedures. All questions concerning disposal should be directed to EH&S.

Safety Data Sheet (SDS) information should be located in an area available to anyone using chemicals. Always consult the SDS when using a chemical for the first time, or when a review of the safety precautions is needed.

Any new chemical, cleaner, or solvent that is brought into the shop must have a copy of the SDS on file in the particular area in which the chemical is used and stored, or provide internet access to this information.

Flammable chemicals must be stored in a designated flammable cabinet. Acids, bases, and strong oxidizing chemicals must be stored in segregated cabinets.

6. Visitor Safety

A “visitor” is defined as a person who is not intending to use shop equipment or hand tools, but must visit the facilities for a short time.

Staff must escort visitors around the Shop area. All visitors must wear long pants and closed toed shoes if they will be in proximity to equipment or storage areas. Otherwise, their movement is restricted to aisle ways.

7. General Safety Practices

- All machines must be operated with all guards and shields in place.
- Never leave a machine tool running unattended unless you have prior approval of the shop staff or manager.
- Always remove any chuck key immediately after use, and place the key in the holder before operating the machinery.
- Personal entertainment devices (e.g. IPODS) with ear pieces cannot be used while using machine tools and welding equipment.
- Lathe chucks must be changed under direct supervision of shop staff. Machine tools and hand tools that are unsafe should not be used, and should be reported immediately to a staff member. Red “Out of Service” tags should be attached to a machine tool or hand tool that needs repair. Shop staff will then lock the machine out until repairs can be made.
- Electrical panels must be kept clear (36 inches) of obstructions so that emergency personnel can access if needed.
- All machines and the surrounding work area must be cleaned and wiped down after use, including sweeping the floor.
- Injuries, no matter how small, must be reported to the shop manager immediately. Anyone who is injured, other than superficial cuts and abrasions, should be seen by a medical professional as soon as possible.
- In the event of fire or building evacuation, everyone must turn off equipment and leave the shop areas immediately.
- Students are not permitted to repair any machinery, or operate electrical disconnect switches or breakers.
- Students are not permitted to operate electrical disconnect switches or breakers.
- Shop staff may reset a breaker one time. If the same breaker trips again, an electrician must be called to determine the source of the overload or short.
- Check the condition of power cords and plugs on portable tools before using them. Do not use a tool that has a worn or damaged power cord/plug.
- All portable power tools must be powered through either a GFCI protected circuit or extension cord.
- Machines must be shut off and locked-out before servicing.
- Clean up area before you leave. Use vacuum to clean up chips, filings… never use compressed air.
